

HOW CAN SAILFISH HELP LAW ENFORCEMENT?

CHALLENGE

Identifying trends in types or locations of crime can be difficult if the data is spread across multiple sources and geographical areas.

OPPORTUNITY

Determine regions in which specific crimes are occurring in order to mitigate future incidences and enact preventative measures.

ANALYTICS

Sailfish can ingest millions of crime incidents from multiple sources to allow for both macroscopic (state, city) and microscopic (district, blocks) investigations of crime distribution. Sailfish can then quickly filter and visualize distributions of offense types by geographical region as well as over time to provide context to the data.

RESULTS

By identifying a specific block within a city district that appears to be a hotspot for aggravated assaults, can prompt targeted efforts to stem future incidences.
